DESIGN DOCUMENT

This is a project for Mobile Devices class made by María Calle, Irene Fernández and Paula Hitz.
Our goal for this assignment is to make a personal Calendar.

The first screens I will talk about are user and account management (blue in the diagram).
- The first screen the user will see is the Welcome screen, which has the profile photo of the last logged in person, the settings button and the button to access the calendar itself.
- The settings button takes you to the settings screen, which offers the possibility of changing the username and the picture, as well as a button to change the account.
- Pressing this button takes the user to a "User selection" screen (in the future we could consider adding the possibility of registering as a new user, but for now we will offer the users that we will implement in the database).
- When selecting an account, the password will be required in order to take you to the welcome screen.

Now onto the calendar itself (pink in the diagram), the Honey Calendar will have three views:
- Year view: every month is displayed (with a little summary -color coded- of the events that it holds)
- Month view: expanded view of the month, every day has a summary of the events in it.
- Day view: expanded view of the day, the hours and events are displayed. On the bottom of this screen there is the "New Event" button.

The new event button takes you to the New Event screen, which lets the user set the name, the date (day, month, year are in it, since it is accessed from a day already) and the urgency of the event/task.
